

Custom insertText event

Here is an example of using `customInsertText` event for managing the insert text mechanism flexibly.

```
var container = document.querySelector('.container'); // Get the main editable container.

container.addEventListener('customInsertText', function(event) {
  // Call 'preventDefault' to prevent WProofreader from replacing text.
  // After that the text replacment mechanism can be handled manually.
  event.preventDefault();

  // Obtain text for replacing from 'detail' field of the 'event' object.
  var text = event.detail.text;

  // Get the selection for the text insertion.
  // The text that is to be replaced are already in the browser Selection.
  var selection = window.getSelection();

  // Keep the error highlighting if needed.
  event.keepHighlight = true;
});
```
