

How to add onclick listener to the WProofreader badge button?

If you need to capture an onclick event, when your end-users click on the WProofreader badge button, you can do the following:

```
var buttons = document.querySelectorAll('.wsc-badge__button');

buttons.forEach(function(button) {
  button.addEventListener('click', function(e) {
    // Do what you want here on badge button click event.
  });
});
```
